

CO2 - Activity 2

- 1) Median Filter: It is used to remove salt and pepper noise from CCTV image.
* It preserve image details while eliminating noisy pixels.
- 2) Gaussian Filter: It is used to reduce gaussian noise in satellite images. It smooths the image & minimizing sensors noise.
- 3) Bilateral Filter: It removes randomly noise in side-like image. It smooths while preserving fine edges. It is ideal for medical x-ray images.
- 4) Median Filter: It removes randomly scattered black and white dots in scanned documents. It improves visibility.
- 5) Gaussian Filter: It reduce heavy graininess in low light images. It smooths the image and improves visibility.
- 6) Histogram Equalization: It enhances the contrast of foggy road images and roads more visible.

7) Improved contrast stretching

The brightness of the contrast of underexposed images. It makes the image appear clearer.

8) clomp. It enhances local contrast in chest X-ray images. It improves visibility of internal structure without noise.

9) Histogram Equalization:

It increases the intensity variation in night ~~time~~ traffic image. This improves overall image visibility.

10) contrast stretching

It expands the narrow intensity range of gray scale image. This enhances the overall image contrast.
